iSimile Broadens Portfolio with netForensics Log Management *nFX Log One Ensures Enterprise Compliance Requirements for Analysis and Storage of Log Data*

iSimile Limited, the leading integrator for Business Service & Security Enterprise Management in the UK, today announced the availability of nFX Log One, the new log management system from netForensics Inc.,

nFX Log One, which is available as an appliance or software solution, has been developed to collect, consolidate and store enterprise-wide security auditing and systems management data. With the addition of the nFX Log One product, iSimile now offers solutions that address the needs of all market segments, from large enterprises to mid-tier and small-to-medium size organisations.

nFX Log One is a cost-effective solution that helps organisations comply with PCI, Sarbanes-Oxley, HIPAA, FISMA, GLBA, and other compliance mandates by collecting, and storing relevant log data from numerous sources. It combines centralised log and event consolidation with powerful secure archival, forensics and trending analysis tools. It collects data from operating systems, business applications, network and security devices, mainframes, access control systems, web services and databases. It also offers a centralised repository to store and analyse event logs.

nFX Log One uses event normalisation to convert event log data into a common format for quick analysis and reporting. It also securely stores the raw log events in a compressed and digitally signed format. This allows network administrators to apply centrally managed policies to the consolidated repository. From there, they can enforce rules and policies, generate alerts and take corrective actions when there is any deviation from the corporate policy or when suspicious activities are detected. nFX Log One makes this data readily available for reporting and audit purposes.

“We are excited to be adding nFX Log One to our product portfolio.” said Terry Boazman, Sales Director, iSimile Limited. “We recognise that SIM functionality is required outside of the large enterprise market and these organisations should have an easy-to-use log and event management solution with a clear migration path to SIM in the future.”

Key benefits of nFX Log One include:

- Provides continuous log aggregation and monitoring -- with real-time alerting
- Collects event logs from systems and applications and automatically sends alerts on critical security events to security console and the email, pager or cell phone of the appropriate IT managers
- Compresses data up to 95% to use less bandwidth, speed data transfer and reduce storage

- Reports and mines data for management and forensics
- Provides summary-level reports to keep executives informed of overall trends
- Includes drill-down capability for routine management and query-based data mining for trend analysis and reporting
- Replays user sessions for forensic analysis
- Provides proof of compliance for auditors
- Maintains audit trails and easily generates a variety of reports to demonstrate policies and policy enforcement to external auditors and regulators
- Provides operational visibility via a management dashboard
- Visually tracks and summarizes activity to ensure managers are aware of security and compliance incidents
- Includes extensive system and device support
- Stores normalised data in a centralised, scalable database for robust, single-source reporting
- Automatically schedules devices for risk assessment and continuous monitoring
- Meets an array of regulatory requirements and standards (SOX, HIPAA, FISMA, FDIC, GLBA, ISO 17799, PCI, etc.)

About iSimile Limited

iSimile deploys Business Assurance solutions into large enterprise and service provider organisations that effectively manage the performance, availability and security of their applications, systems and infrastructure.

iSimile is a privately held Company incorporated in December 2002, that designs, implements, and supports a range of business-focused solutions that include:

- Business service management
- Application performance management
- Network health management
- System & application management
- Security risk management
- Event consolidation and correlation
- IT security surveillance and packet-level forensics
- Vulnerability management
- Intrusion detection
- Dynamic intrusion prevention
- Security intelligence reporting
- Incident Management

iSimile's solutions are based on best-of-breed products from Apani, CA, netForensics, nCircle and Niksun and are implemented to meet the challenges of maintaining business continuity and providing the productivity, performance and protection that large organisations require from their IT investments and resources.

iSimile offers a full range of professional services in support of its product portfolio. Assessment, installation and customisation are provided to ensure ease of implementation and a number of comprehensive training courses are available designed to meet the needs of both administrators and analysts.
